(54) Title: ASSEMBLY FOR GUIDING TOY VEHICLE

(57) Abstract: A track layout for guiding toy vehicles is formed from a number of rectangular tiles (1). Each tile has at least two distinct pathways for the vehicle to increase the track density per tile in comparison with known systems of a similar type. The tiles can be orientated in any one of eight different positions. Each face (3) of each tile has one or more female parts (10) of a connector, and separate male part (21) of the connector holds the tiles together. The connector may be constructed from a number of different components, and has a circumjacent flange (23) that helps prevent vertical movement between the tiles.
